

1. Write a JSX program in React to demonstrate all important JSX rules. The program should include:

- **Use of a single parent element or Fragment**
- **JavaScript expression inside JSX using { }**
- **Inline CSS styling using camelCase properties**
- **External CSS using className**
- **JSX comments**
- **Ordered list display**
- **Self-closing tags**
- **Display of images from both assets and public folders**

The program should display a welcome message using a variable, a list of fruits, styled text, and images using JSX syntax

2. Create a React component that contains an array of student objects with:

- **id**
- **name**
- **standard (std)**

Perform the following tasks using filter() and map():

- 1. Display only students whose standard is 5.**
- 2. Increase their standard by 1.**
- 3. Display student name and updated standard.**

3. Create a React application using props to display student details.

Requirements:

- 1. Create a parent component Prop1.jsx.**
- 2. Pass the following data to child component Prop2.jsx using props:**
 - **student name**
 - **roll number**
 - **marks**
- 3. In child component:**
 - **display student details**
 - **increase marks by 1 and display updated marks**

4. Create a React application using props to pass an object from one component to another component.

Requirements:

1. Create a parent component Example1.jsx.
2. Create an object named Details containing:
 - Student_name
 - University_name
3. Pass the Details object to child component Example.jsx using props.
4. In child component:
 - receive the object using props
 - display student name and university name in browser
5. Build a React app that displays a list of products using props.
 - Create a ProductCard component to show product details like title, price, rating, and image.
 - Use a ProductList component to store product data and display multiple ProductCard components using .map().
